Night owl surveillance camera review

Night owl security cameras. Night owl cameras review. Night owl wireless camera. Night surveillance camera. Night owl surveillance system.

Night Owl Security Cameras: A Popular Choice for Home and Business Owners Our site earns a commission on purchases made through our links. Experience home security from anywhere with Night Owl's app, which offers real-time monitoring without subscription fees or device limitations. The app sends push notifications when motion or sound is detected, keeping you informed of any unusual activity at your property. With a wide range of security cameras available, Night Owl provides 8-channel indoor/outdoor systems featuring five 800TVL cameras, as well as more advanced systems with up to 16 channels and high-definition 1080p cameras. One key consideration is that night vision cameras' quality depends on the amount of light they receive. While some cameras may boast impressive specifications, they won't produce high-quality footage if there's insufficient lighting. The Night Owl security camera system offers a comprehensive solution, allowing remote real-time monitoring and weatherproof cameras with up-to-100-foot night vision. Additionally, built-in microphones enable audio communication through the system when needed. Regardless of the system you choose, you'll enjoy crystal-clear clarity in your surveillance experience, making it easy to keep an eye on your property. You can even add audio components for two-way communication. Founded back in 2009, Night Owl Home Security started creating affordable video surveillance gear that's super easy to use and actually works well. They're got a bunch of different systems, including wired digital video recorders (DVR) and network video recorders (NVR), plus some wireless ones and cameras too. The idea is to give customers top-notch security equipment they can use in their homes or businesses. Their gear falls into three main categories: wired systems, wireless systems, and individual cameras. Each one has its own set of features, so people can choose what suits them best. The wired systems are split into DVR and NVR ones. DVRs are a bit cheaper, work with dual sensors, and play nice with older CCTV stuff, but they need multiple cables for setup. NVRs give crisper images, fewer cables to mess with, and are easier to install, but they cost more and don't work with some older camera types. Both kinds of wired systems can do things like record 24/7, let people check in remotely through the Night Owl app, and have multiple security modes. Here's a quick rundown of the differences between DVR and NVR: **System Comparison** | Feature | DVR | NVR | | --- | --- | --- | | Camera Type | Analog | IP | | Cable Type | Coaxial BNC | Ethernet | | Max Cable Run Length per Camera | 300 feet | 1,000 feet | | Number of Available Kits | 23 | 6 | Some popular Night Owl DVR wired security kits include: - **CAN-C80XFR-82-4L**: This is an eight-channel system with 4K video and two terabytes of storage. It comes with four spotlight cameras that can spot faces and send alerts, and it's compatible with smart devices and computers. - **C5XFR2L-168-B**: This one has eight 5MP wired spotlight cameras and can store up to two terabytes of video on its hard drive. The system is expandable to 16 channels, so you can add more gear if needed. Security breach reported at home! The Night Owl system features intelligent motion detection and improved nighttime vision, utilizing four 1080p cameras to send alerts about heat and movement. These weather-resistant cameras can be viewed on computers, smartphones, or tablets without any monthly fees. The available security kits include expandable systems with various camera numbers: the IC8-16144-B kit has 14 included cameras, while the IC802-84 kit starts with four cameras that can be expanded as needed. All kits come with a 4K Ultra HD system and two terabytes of storage. Each Night Owl camera uses L2 Color Boost technology to capture full-color video at night and features motion sensors for real-time alerts on mobile devices. The brand offers wireless security solutions, including expandable or complete systems that allow users to grow their setup as needed. Recorded videos can be sent to the mobile app or computer using free Night Owl software. The three wireless systems offered by Night Owl include: WNVRC20-841, a system with four 1080p cameras and one terabyte of storage; WG4-2I-16SD-B, a four-channel system with two indoor wireless cameras compatible with Google Assistant; and WG4-4OU-16SD-B, which comes with four AC-powered cameras for full security coverage. Additionally, Night Owl provides standalone camera offerings, including a smart doorbell camera that can operate independently or supplement an existing video system. Replaces your existing doorbell with high-definition video and audio capabilities. This smart doorbell allows footage to be displayed on a TV using voice commands and stored in the cloud for later use. The wireless camera has a wide-angle view, enabling two-way communication and facial recognition technology that identifies individuals from 10 feet away. Some features include motion-activated spotlights, full-color night vision, and remote access through a dedicated app without monthly fees. Night Owl's video surveillance systems offer mobile accessibility and monitoring capabilities via phone or computer. Professional installation is recommended for each camera and system due to complex wiring requirements. Users can review recorded footage, utilize two-way audio features, and access various settings directly from their devices. For customer support, Night Owl provides 24/7 phone assistance at 1-866-390-1303 and a live chat function online. Returns are accepted within the first 30 days of purchase with varying refund policies depending on item condition. Regarding company ratings, Night Owl holds an F rating from the Better Business Bureau (BBB), stemming from customer complaints about app connectivity issues, unhelpful customer service, and general dissatisfaction. A sample BBB review states: "Their app won't connect to the device 98% of the time. Customer service is no help." Another review mentions a poor customer service experience, leading the reviewer to advise against purchasing Night Owl's product. **Security Company Review** Night Owl is a company offering various video surveillance equipment for homeowners, including indoor and outdoor cameras, as well as doorbell cameras and systems. However, many customers have questioned their customer service. For those considering Night Owl, comparing it with other top-rated security companies like Abode, Vivint, or ADT may be beneficial. Here's a comparison of the providers: | Provider | Equipment Prices | Monitoring Prices (per month) | Contract Required | | --- | --- | --- | --- | | Abode | $149-$1,249 | $45.99 | No | | Vivint | $599 and up | $40 and up | 36 months | | ADT | pricing by quote ($99 and up) | $29 and up | Yes | Night Owl cameras can record without internet but require Wi-Fi for remote viewing through the app. Troubleshooting connection issues involves ensuring proper app use, device connectivity to the internet, meeting minimum requirements, restarting devices, checking network conditions, or contacting technical support. Some Night Owl offerings, such as indoor panoramic cameras, support two-way audio for communication with the other end. The company provides a one-year warranty on workmanship and material defects. No internet connection is needed to record footage, but Wi-Fi is required for remote viewing through the application. If experiencing connection failure or degradation, users should restart devices, ensure correct app usage, meet minimum requirements, check network conditions, or contact technical support. System evaluation criteria include features like special options, installation choices, connectivity, smart-home automation, pricing, warranty, usability, trial period availability, and trustworthiness to reach a final score out of 100. Video quality is complex with DVRs like Night Owl's, as it supports resolutions up to 1080p but may vary with add-on cameras. The included cameras reached 1080p resolution, which is standard for security cameras today. However, color quality was subpar in dim environments and only decent in well-lit spaces. In contrast to wireless cameras like the Ring Stick Up Cam and Wyze Cam Outdoor, Night Owl's video quality doesn't compare favorably due to easier installation requirements for those models. Viewing video on a monitor connected to the DVR yields crisp images without noticeable motion blur at distances. However, renters in apartments might experience slight motion blurring when viewing livestreams on the mobile app, especially with people directly in front of the camera. The system's adjustable frame rate is a significant advantage, allowing users to set it from one fps to 30 fps. While high settings (like 30 fps) provide smooth movement but consume more storage space, lower settings (like 12-20 fps) use less space and are suitable for most users. The DVR also comes with preset picture settings tailored to different environments: standard, outdoor, indoor, and indoor dim. You're looking at security cameras that can provide clear footage, even in low-light conditions. The Night Owl system comes with four weatherproof cameras, each having powerful infrared LEDs for up to 100 feet of night vision range. This is a step up from many Wi-Fi security cameras that only offer about 25 feet of night vision. For those who want the most accurate color representation possible, there's also an option for bright spotlights for color night vision. However, one thing to note is that each camera has a relatively narrow field of view (80º), which might limit how much it can capture compared to other wireless cameras that average around 130º. To make up for this, having multiple cameras in the system does help ensure a broader coverage area. Each camera comes with a 60-foot video/power cable, allowing them to be placed strategically throughout an average-sized home as long as the DVR is centrally located. It's recommended to secure these cables along walls or purchase cable runs/covers to conceal them, which can also protect against tampering. Additionally, each camera features an infrared motion sensor that triggers recording and notifications when it detects movement. The system does not currently support audio capabilities, but Night Owl offers cameras with audio or two-way audio functionality for customers who need this feature.
